FIVE OUTSTANDING

THE STARN CLING

This superb late cling peach (Phillips season) originated on the J. E. Starn Ranch near Hughson in 1935. For a number of years we have been observing this variety and are convinced that it is the best of all the late clings, and that it should be introduced in all cling peach districts.

In 1943 the Starn Cling was planted in the University of California Test Orchard on the Frank Merriam Ranch near Hickman. These trees, now ten years old, have shown it to be the heaviest bearer of all the late clings. No defects have shown up during this entire period. In 1948 the first commercial planting was made in Stanislaus County, and in 1949 three more plantings were made. These four orchards are now all in commercial production.

But we are especially interested in the Starn Cling because of its superior flavor. It has been repeatedly tested by the University of California in cooperation with the Cling Peach Advisory Board, and has consistently placed among the best. At the cut-out test held in Stockton in December, 1951, it rated higher in flavor than any other cling peach, except the Dix varieties (see below).

The importance of better eating quality cannot be over-emphasized. One of the soundest ways to increase the demand for cling peaches is to grow and can peaches of better flavor. Advertising can do much to introduce our product to the consumer, but with so many fruits on the market it takes superior quality and FLAVOR to bring the customer back for more cling peaches.

Mr. Starn has graciously given us the privilege of introducing this superior cling peach. There is no royalty on it, and no restrictions against its propagation.

THE MERRILL FIESTA FREESTONE

One of the best Grant Merrill varieties. This is a late freestone, shipping and freezing peach ripening in our orchard about the middle of September. It is large, very well colored, a heavy bearer, and firm enough to ship throughout the entire country. Late peaches at this period brought 10c to 12c in the Los Angeles market in 1953; many of them not as good in quality as the Merrill Fiesta.

For those who are looking for a late peach, to market after the heavy shipments of mid-season varieties are finished, we believe you cannot do better than to plant the Merrill Fiesta. (Royalty 80c per tree. Sold in commercial lots only).

THE HIRAOKA FLAME FREESTONE

The Hiraoka Flame is a handsome shipping peach ripening about five days before J. H. Hale. It has large size, and good color and firmness; is smooth and symmetrical in appearance.

The variety was developed by Harry Hiraoka of Fowler,

Orchardists are always welcome to inspect our

NG NEW VARIETIES

Fresno County in 1939. It has been in commercial production about eight years. It has proven to be a heavy bearer and a fine market peach. It is a much better bearer of No. 1 fruits than J. H. Hale, and also has the advantages of being a few days earlier and having self-fertile blossoms. A proven money maker. (Royalty 80c per tree).

THE ROSE NECTARINE

Originated by Fred Anderson, of LeGrand, California's leading breeder of new nectarines. Exclusive propagating rights were purchased by us in 1953.

We believe this nectarine will take the place of the John Rivers as its superior qualities become known. It is white fleshed; ripening with that variety. It is smooth and symmetrical, with beautiful red coloring on the surface. Its chief advantages over John Rivers are its regular bearing habits and its complete freestone character.

The John Rivers has proven itself to be an excellent money maker in the San Joaquin Valley during those years when it bears a good crop. But it is an erratic bearer; especially likely to fail after a warm winter. The Rose nectarine has borne regularly and heavily every year.

Most early nectarines and peaches are either clingstones or only partially free. The Rose is a complete freestone, and thus would be adapted for both freezing and canning, as well as fresh shipment.

It is firm enough to ship well. Its eating quality is excellent, having the true nectarine flavor, so popular with consumers, and demanded by commercial canners and freezers of nectarines. (Royalty \$1.50 per tree).

THE DIX 6-6 CLING PEACH

Originated by the late Frank Dixon; tested and introduced by the University of California College of Agriculture.

Mr. Dixon spent many years of his life breeding canning clings of BETTER FLAVOR, as he was convinced that more highly flavored varieties were needed if the cling peach was to maintain and increase its popularity with the consumer. He originated a number of new and highly flavored clings ripening throughout the canning season, and these are all being tested by the College.

The first to be released is the Dix 6-6. (The Dix 6-8 has also been released, but it appears to be almost identical with the 6-6). It is early ripening, seven days after Fortuna, and fills the gap between Fortuna and Cortez. It is a large, well shaped, beautiful cling and a heavy bearer. But its most outstanding quality is its higher flavor; definitely superior to any of the commercial clings now being canned.

Its desirable time of ripening and unmatched flavor should make it one of our leading varieties. (No increase in price of trees).
